Database: N_Geneseq_36:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Human secreted pro Rabbit zona pelluc Rabbit zona pelluc Rabbit zpc cDNA. I Phosphate starvati Coding sequence fo Sequence of human Human pro-growth h Sequence encoding Clone 2386p102 enc Sequence of the cD	n coding sequence. alphaENACs; alphaENACb; binding as alpha subunit; membrane-transport; ker; ss.	P-PSDB; W34529. P-ternatively spliced epithelial sodium channel alpha subunit proteins - useful in screening assays for salty taste enhancers or blockers Bolockers Disclosure; Column 21-22; 33pp; English. This sequence represents the coding sequence for the alpha epithelial sodium channel a (alphaENRCa). AlphaENRCa and alphaENNCb (see W34530) sodium channel a (alphaENRCa). AlphaENRCa and alphaENNCb (see W34530) alternatively spliced forms of the invention. The two sodium channels are alternatively spliced forms of the amiloride-sensitive salt channel alpha subunit and can be used in membrane-transport or binding assays to identify substances that enhance or block perception of a salty taste. Enhancers could be used as salt substitutes and blockers could be used to mask salty tastes in foods and pharmaceuticals. Sequence 75 BP; II A; 22 C; 22 G; 20 T;	10 10 10 10 10 10 10 10

                                                                                                                                                                               Claim 1; Page 859; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.

Combile-stranded DNA) which comprises one of the 7837 "GS" sequences

Gouble-stranded DNA, or many strands or the corresp.

Gouple-stranded DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

sequences were obtained from 3'-directed cDNA libraries prepared

from various human tissues; synthesis of cDNA was initiated from the

3'-end of mRNA by using poly(7) as the sole primer. Since the 3'-

untranslated sequence is unique to a particular mRNA species, almost

all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

is constructed so as to reflect accurately the relative abundance of

different mRNAs in the particular tissue from which it was derived.

The appearance frequency of a given GS in a cDNA library can be

cetermined (esp. using primers and probes derived from the GS.

sequences) as a means of diagnosing abnormal cell function or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FIGA insert stabilising polypeptide encoding DNA.

New fusion proteins resistant to proteolytic degradation comprising a core protein with a stabilising polypeptide comprising PT comprising a core protein with a stabilising polypeptide sequence containing glycine repeats

Disclosure: Fig 3: 120pp; English.

Core protein to proteolytic degradation that comprises linking or inscarting onto or into the core protein a stabilising polypeptide of formula [(Glya)X(Glyb)X(Glyc)Z]n where Glya, Glyc are 1-6

Cormula [(Glya)X(Glyb)X(Glyc)Z]n where Glya and Inserted into

Cormula [(Glya)X(Glyb)X(Glyc)Z]n where Glya and Inserted into

Cormula [(Glya)X(Glyb)X(Glyc)Z]n where Glya and Inflammatory bowel disease, or a nitroreductase protein

Cormula for treating autoimmune diseases, or a nitroreductase protein

Cormula for pathological conditions. The fusion proteins can also be used in

Cormula for methods such as in vivo imaging.

Corputer pathological conditions. The fusion proteins can also be used in

Corputer pathological conditions. The Glya and Some and Corputer Cormula in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   18-NOV-1998 (first entry)
Nucleotide sequence of the stabilising sequence-encoding insert.
Nucleotide sequence of the stabilising sequence-encoding insert.

Promptising a core protein with a stabilishing polypeptide comprising

Promptising a core protein with a stabilishing polypeptide comprising

Tomptising a core protein with a stabilishing polypeptide comprising

Promptising a core protein might be stabilishing sequence-encoding

Crisis a nucleotide sequence of the stabilishing sequence-encoding

insert. The invention provides a method for increasing the resistance

Crisis a nucleotide sequence of the stabilishing polypeptide of

formula (Glya) X(Glyb) Y(Glyc)Zl) where Glya, Glyc are 1-6

criserting onto or into the core protein a stabilishing polypeptide of

formula (Glya) X(Glyb) Y(Glyc)Zl) where Glya, Glyc are 1-6

sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ije, Leu, Met,

Criserting onto or an be anything between 1-66 X, Y and Z need not

complete acid encoding a core protein. The fusion proteins of the

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can be linked onto or inserted into

concoding the stabilishing polypeptide can inserted into

concoding the stabilishing polypeptide can introductase protein

concoding the stabilishing polypeptide can inserted into

concoding the pathological conditions. The fusion proteins can also be used in

dlagnostic methods such as in vivo imaging therapy to treat cancer

concoding the pathological conditions. I

This polynucleotide comprises the DNA sequence of vector plasmid pelby disclosure; Page 77-80; 100pp; English.

This polynucleotide comprises the DNA sequence of vector plasmid of reward region for EBV) origin of replication from plasmid pcEP4, a coding region for EBV nuclear antigen A from pcEP4, a pair of inverted terminal repeats from adeno-associated virus, a cytomegalovirus enhancer/promoter, a bovine growth hormone polyA sequence, and a kanamycin resistance selectable marker. Polynucleotides encoding polypeptides, such as crythropoietin or leptin, and ribozymes and antisense cythropoietin or leptin, and ribozymes and matcheds for improved colynucleotides can be inserted into the vector. The vector is preferred for use in novel compositions and methods for improved colynucleotide delivery into cells. In these methods, polycationic agents are used to increase the frequency of uptake of a nucleic acid caid (see also v21684-86) into a cell. The polycationic agent can condense with the nucleic acid and inhibit serum and/or nuclease degradation of the nucleic acid. The nucleic acid can be a vector, may express a therapeutic protein or a vaccinating viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1881 cttcgacctcctggtcatcacacttctcatgctgctacgccggttccggagccggtactg 1940

WPI; 93-386573.48.
Hepatocyte growth factor variants - are resistant to proteolytic cleavage into its two-chain form, used to treat malignancies associated with HGF receptor.
Example 1; Fig 6; 87pp; English.
Plasmid pcissBoN (a pRK5 derivative) is an episomal CMV driven expression plasmid. HUHGF variants with enhanced receptor binding activity were produced by site-directed mutagenesis. Stable populations of preferred HGF variants were obtained by transfecting human embryonic kidney 293 cells and then these were subcloned in
                                                                                                                                                                                                                                                                     1947

Why yet yet yet yet are the control of the tringle domains based on their homology to kringle-like domains in other proteins, e.g. prothrombin, plasminogen. The beta subunit shows high homology to the catalytic domain of serine proteases are not conserved in HGF. Therefore, the precise function of the beta chain remains unknown. The invention includes HGF serine proteases are not conserved in HGF. Therefore, the precise function of the beta chain remains unknown. The invention includes HGF serine proteases are not conserved in HGF. Therefore, the precise function of the beta chain remains unknown. The invention of a HGF serine protease are not conserved in HGF. Therefore, the precise the cological activity of wild-type HGF. They can be used for the treatment of pathological conditions associated with the activity of a HGF receptor activation. The priseBoN plasmid comprising the HGF coding sequence of the variant HGF's of the invention.
                                                                                                                                                  ;;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          09-DEC-1996 (first entry)
Plasmid pcisEBON for expression of hepatocyte growth factor.
Human; hepatocyte growth factor; HGF; huHGF; serum; proteolytic cleavage; pro-hormone; beta subunit; alpha subunit; kringle domain; prothrombin; plasminogen; catalytic domain; serine protease; HGF variant;
Synthetic.

Filterin Computation process and for treating neurodegeneration

Figure 13; Page 28-30; 64pp; French.

Claim 13; Page 28-30; 64pp; French.

Claim 13; Page 28-30; 64pp; French.

Cationic channel that is sensitive to amiloride and activated by protons

cationic channel that is sensitive to amiloride and activated by protons

and is designated Acid Sensing Ionic Channel (ASIC). The protein can be

compounds that modulators of these channels, particularly to identify

compounds that modulate perception of acidity, as regards nociception

(pain) rather than taste. These compounds are used to treat or prevent

pain associated with acidity (e.g. in cases of inflammation, ischaemia

CC pain associated with acidity (e.g. in cases of inflammation, ischaemia

CC or some tumours) and as inhibitors of neurodegeneration caused by

Coverexpression of the channels. Antibodies to the protein are used to

detect the channels in tissues, and to act therapeutically as channel

CC modulators. The nucleic acid can be used to generate transgenic,

cmodulators. The nucleic acid can be used to generate disorders,

particularly knockout, animals for studying ASIC-related disorders,

also for gene therapy. The channel protein, or its (ant)agonists, can

be used to treat or prevent cerebral neurodegenerative conditions (e.g.

Alzheimer's, Parkinson's or Huntington's diseases, amyotrophic lateral

Claim 12; Pages 59-60; 102pp; Japanese.
Che present sequence encodes mouse thymus and activation regulated chemokine (TARC), which is similar to CC type chemokines and expressed in peripheral blood monocytes under immunological stimulus, e.g. phyto-haemagglutinin or soluble cytckine, and the thymus, but not by the spleen. TARC is active against CCR4 expressing cells, e.g. T cells, peripheral lymphocytes and activated peripheral T cells, especially Hut 78, Hut 102, Jurkat, MT2 and MT4 cells, and is useful as an immunomodulator or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New CC-chemokine-like protein - is expressed by peripheral blood monocytes under immunological stimulus, useful as immunomodulator

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This polynucleotide corresponds to the mouse homologue, muREC2, of the REC2 gene (UnREC2) of USILiago maydis, and codes for an ATP manned and codes for an ATP manned to recombinase (see W56565). Overexpression of mammalian REC2 in a cell was found to facilitate homologous recombination between an exogenous DNA and the genome of a cell. It also sensitises the cell to DNA damage, e.g. by gamma or UV radiation or from cytotoxic agents. This causes the cell to undergo apoptosis in response to DNA damage. MuREC2 can be used to construct transgenic animals. REC2 knock-out mice are useful as models for tumorigenesis induced by chemical carcinogens. The hSREC2 human homologue gene (see V22703) is also claimed, which can be used in gene therapy methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

This sequence represents a probe for the coding sequence for the alpha This sequence represents a probe for the coding sequence for the alpha application channel a (alphaENACa). AlphaENACa (see W34529) and alphaENACb (see W34530) represent the sequences of the invention. The two sodium channels are alternatively spliced forms of the amiloride-sensitive salt channel alpha subunit and can be used in membrane-transport or binding assays to identify substances that enhance or block perception of a salty taste. Enhancers could be used as salt substitutes and blockers could be used to mask salty tastes in foods and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Probe Ena A9 for alphaEnAc coding sequence. Alpha epithelial sodium channel; alphaENACa; alphaENACb; binding assay; amiloride-sensitive salt channel alpha subunit; membrane-transport;
                                                                                                                                                                                                    24-MAR-1998 (first entry)
Probe Bna-A7 for alphaENAC coding sequence.
Alpha epithelial sodium channel; alphaENACa; alphaENACb; binding assay; amiloride-sensitive salt channel alpha subunit; membrane-transport;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a probe for the coding sequence for the alpha epithelial sodium channel a (alphaENACa). AlphaENACa (see W34529) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alternatively spliced epithelial sodium channel alpha subunit proteins – useful in screening assays for salty taste enhancers or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alternatively spliced epithelial sodium channel alpha subunit proteins – useful in screening assays for salty taste enhancers or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Page 262, 464pp; English.

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. X27302) for increasing the stability of the fused protein as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The Invention relates to 123 novel genes and their fragments (nucleic acid sequences: X27311-X27449; amino acid sequences Y02650-Y02788) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 123 polynucleotides, based on which tissues they are most highly expressed in (see X27311 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2982 tgtggtcagggatgagatttgctctgttttgtatccttccggtctagcccagtctcccac 3041

The invention relates to nucleic acid sequences (X22211 to X22282) encoding human secreted proteins (Y01383 to Y01454). The secreted protein encoding human secreted proteins (Y01383 to Y01454). The secreted protein sequences are deposited with the ATCC under deposit number ATCC 209138, 209139 or 209141. Host cells containing vectors comprising the nucleic acid sequences are used for the recombinant expression of the secreted proteins. The polynucleotide and amino acid sequences are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Pathological conditions can be also diagnosed by determining the amount of the new polynucleotides in a sample or by the presence of mutations in the new polynucleotides. The nucleic acid
alphaENACb (see W34530) represent the sequences of the invention. The two sodium channels are alternatively spliced forms of the amilorides-sensitive salt channel alpha submit and can be used in membrane-transport or binding assays to identify substances that enhance or block perception of a salty taste. Enhancers could be used as salt substitutes and blockers could be used to mask salty tastes in foods and
                                                                                                                                                                                                                                                                                                                                                                                                        Human secreted protein gene 20 clone HGCAB62.

Human: secreted protein gene therapy; protein therapy; cancer; weight; tumour; chromosome mapping; forensic; hemantological disease; allergy; inflammation; cell proliferation; viral infection; wound healing; modulation; appetite; behaviour; food additive; preservative; ss.

sequences, or its fragments, are useful for chromosome identification and mapping; as antisense and triplex-forming therapeutics; in gene therapy; Cr (forensic) identification of individuals; as molecular weight markers; to identify related sequences or specific mRNA; in preparation of oligomers and to raise anti-DNA antibodies. Antibodies are useful as immunoassay reagents (including for in vivo imaging) and therapeutically to inhibit or activate particular polypeptides. A very wide range of disorders may be treated with the polynuclectide and polypeptide sequences, e.g. autoimmune or haematological diseases, allergy, inflammation, cancer or other forms of cell proliferation, viral or other inflammation. The sequences may also be useful in wound healing, to modulate differentiation of embryonic stem cells, to modulate weight, appetite, behaviour etc. and as food additive or preservative. The present sequence represents a gene encoding a human secreted protein (see descriptor line for gene number and clone identification).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKE2); Email s.wiemann@dkfz- heidelberg.de;
sequenced by LMU (Ludwig Maximilians University,
Munich/Germany) within the cDNA sequencing consortium of the German
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chordata; Craniata; Vertebrata; Euteleostomi;

/ncte="Organ: Kidney; Vector: pME18S-FL3; Site_1: DraIII
(CACTGTGTG); Site_2: DraIII (CACCATGTG); 1st strand cDNA
was primed with an oligo(dT) primer
[ATGTGGCTTTTTTTTTTTTTTTT]; double-stranded cDNA was
[ATGTGGCTTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCTACTGG], digested
and cloned into distinct DraIII sites of the pWE18S-FL3
vector (5' site CACTGTGG, 3' site CACCATGTG). Xhol should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTGTAAAAGGTGCG and 3' end
primer CGACCTGCAGCTGGAGAA."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                      * NOTE: This is a 'working draft' sequence. It currently consists of 16 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * trus of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Web site: http://www-seq.wi.mit.edu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CONTE: This is a 'working draft' sequence. It currently consists of 15 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
